General Specifications

The following tables list the 5522A specifications. All specifications are valid after allowing a warm-up period of 30 minutes, or twice the time the 5522A has been turned off. (For example, if the 5522A has been turned off for 5 minutes, the warm-up period is 10 minutes.)

All specifications apply for the temperature and time period indicated. For temperatures outside of $\pm 5^\circ\text{C}$ (t_{cal} is the ambient temperature when the 5522A was calibrated), the temperature coefficient as stated in the General Specifications must be applied.

The specifications also assume the Calibrator is zeroed every seven days or whenever the ambient temperature changes more than 5°C . The tightest ohms specifications are maintained with a zero cal every 12 hours within $\pm 1^\circ\text{C}$ of use.

Also see additional specifications later in this chapter for information on extended specifications for ac voltage and current.

Warmup Time Twice the time since last warmed up, to a maximum of 30 minutes.

Settling Time Less than 5 seconds for all functions and ranges except as noted.

Standard Interfaces IEEE-488 (GPIB), RS-232

Temperature

Operating 0°C to 50°C

Calibration (t_{cal}) 15°C to 35°C

Storage -20° to $+50^\circ\text{C}$; The DC current ranges 0 to 1.09999 A and 1.1 A to 2.99999 A are sensitive to storage temperatures above 50°C . If the 5522A is stored above 50°C for greater than 30 minutes, these ranges must be re-calibrated. Otherwise, the 90 day and 1 year uncertainties of these ranges double.

Temperature Coefficient Temperature coefficient for temperatures outside $t_{\text{cal}} \pm 5^\circ\text{C}$ is $0.1/X/^\circ\text{C}$ of the 90-day specification (or 1-year, as applicable) per $^\circ\text{C}$

Relative Humidity

Operating $<80\%$ to 30°C , $<70\%$ to 40°C , $<40\%$ to 50°C

Storage $<95\%$, non-condensing. After long periods of storage at high humidity, a drying-out period (with power on) of at least one week may be required.

Altitude

Operating 3,050 m (10,000 ft) maximum

Non-operating 12,200 m (40,000 ft) maximum

Safety Complies with EN/IEC 61010-1:2001, CAN/CSA-C22.2 No. 61010-1-04, ANSI/UL 61010-1:2004;

Output Terminal Electrical Overload Protection Provides reverse-power protection, immediate output disconnection, and/or fuse protection on the output terminals for all functions. This protection is for applied external voltages up to $\pm 300\text{ V}$ peak.

Analog Low Isolation 20 V normal operation, 400 V peak transient

EMC Complies with EN/IEC 61326-1:2006. If used in areas with Electromagnetic fields of 1 to 3 V/m, resistance outputs have a floor adder of $0.508\ \Omega$. Performance not specified above 3 V/m. This instrument may be susceptible to electro-static discharge (ESD) from direct contact to the binding posts. Good static aware practices should be followed when handling this and other pieces of electronic equipment.

Line Power Line Voltage (selectable): 100 V, 120 V, 220 V, 240 V

Line Frequency: 47 Hz to 63 Hz

Line Voltage Variation: $\pm 10\%$ about line voltage setting

For optimal performance at full dual outputs (e.g. 1000 V, 20 A) choose a line voltage setting that is $\pm 7.5\%$ from nominal.

Power Consumption 600 VA

Dimensions (HxWxD) 17.8 cm x 43.2 cm x 47.3 cm (7 in x 17 in x 18.6 in) Standard rack width and rack increment, plus 1.5 cm (0.6 in) for feet on bottom of unit.

Weight (without options) 22 kg (49 lb)

Absolute Uncertainty Definition The 5522A specifications include stability, temperature coefficient, linearity, line and load regulation, and the traceability of the external standards used for calibration. You do not need to add anything to determine the total specification of the 5522A for the temperature range indicated.

[1]

Continuously variable from 0 Ω to 1.1 G Ω.

[2]

Applies for 4-WIRE compensation only. For 2-WIRE and 2-WIRE COMP, add 5 µV per Amp of stimulus current to the floor specification. For example, in 2-WIRE mode, at 1 kΩ the floor specification within 12 hours of an ohms zero cal for a measurement current of 1 mA is:
0.002 Ω 5 µV / 1 mA = (0.022 + 0.005) Ω = 0.007 Ω.

[3]

For currents lower than shown, the floor adder increases by Floor(new) = Floor(old) x Imin/Iactual. For example, a 50 µA stimulus measuring 100 Ω has a floor specification of: 0.0014 Ω x 1 mA/50 µA = 0.028 Ω assuming an ohms zero calibration within 12 hours.

[1] Duty Cycle: Currents <11 A may be provided continuously. For currents > 11 A, see Figure B. The current may be provided 60-T-I minutes any 60 minute period where T is the temperature in °C (room temperature is about 23 °C) and I is the output current in Amps. For example, 17 A, at 23 °C could be provided for 60-17-23 = 20 minutes each hour. When the 5522A is outputting currents between 5 and 11 amps for long periods, the internal self-heating reduces the duty cycle. Under those conditions, the allowable "on" time indicated by the formula and Figure B is achieved only after the 5522A is outputting currents <5 A for the "off" period first. [2] For currents >11 A, Floor specification is 4000 μA within 30 seconds of selecting operate. For operating times >30 seconds, the floor specification is 2000 μA. [3] For currents >11 A, Floor specification is 1000 μA within 30 seconds of selecting operate. For operating times >30 seconds, the floor specification is 5000 μA. [4] Subject to compliance voltages limits.

[1] The output is continuously variable from 220 pF to 110 mF. [2] Specifications apply to both dc charge/discharge capacitance meters and ac RCL meters. The maximum allowable peak voltage is 3 V. The maximum allowable peak current is 150 mA, with an rms limitation of 30 mA below 1.1 μF and 100 mA for 1.1 μF and above. [3] The maximum lead resistance for no additional error in 2-wire COMP mode is 10 Ω.

Notes The range of voltages and currents shown in "DC Voltage Specifications," "DC Current Specifications," "AC Voltage (Sine Wave) Specifications," and "AC Current (Sine Wave) Specifications" are available in the power and dual output modes (except minimum current for ac power is 0.33 mA). However, only those limits shown in this table are specified. See "Calculating Power Uncertainty" to determine the uncertainty at these points. The phase adjustment range for dual ac outputs is 0 ° to ±179.99 °. The phase resolution for dual ac outputs is 0.01 degree.

To calculate exact ac Watts power adders due to phase uncertainty for values not shown, use the following formula: $Adder(\%) = 100(1 - \frac{\cos(\Phi + \Delta\Phi)}{\cos(\Phi)})$ For example: for a PF of .9205 ($\Phi = 23$) and a phase uncertainty of $\Delta\Phi = 0.15$, the ac Watts power adder is: $Adder(\%) = 100(1 - \frac{\cos(23+0.15)}{\cos(23)}) = 0.11\%$								

Calculating Power Uncertainty

Overall uncertainty for power output in Watts (or VARs) is based on the root sum square (rss) of the individual uncertainties in percent for the selected voltage, current, and power factor parameters:

$$\text{Watts uncertainty } U_{\text{power}} = \sqrt{U_{\text{voltage}}^2 + U_{\text{current}}^2 + U_{\text{PFadder}}^2}$$

$$\text{VARs uncertainty } U_{\text{VARs}} = \sqrt{U_{\text{voltage}}^2 + U_{\text{current}}^2 + U_{\text{VARsadder}}^2}$$

Because there are an infinite number of combinations, you should calculate the actual ac power uncertainty for your selected parameters. The method of calculation is best shown in the following examples (using 1 year specifications):

Example 1 Output: 100 V, 1 A, 60 Hz, Power Factor = 1.0 ($\Phi=0$).

Voltage Uncertainty Uncertainty for 100 V at 60 Hz is 150 ppm + 2 mV, totaling:

$$100 \text{ V} \times 190 \times 10^{-6} = 19 \text{ mV added to 2 mV} = 21 \text{ mV. Expressed in percent: } 21 \text{ mV}/100 \text{ V} \times 100 = 0.021 \% \text{ (see "AC Voltage (Sine Wave) Specifications").}$$

Current Uncertainty Uncertainty for 1 A is 0.05 % 100 μA , totaling:

$$1 \text{ A} \times 0.0005 = 500 \mu\text{A added to } 100 \mu\text{A} = 0.6 \text{ mA. Expressed in percent: } 0.6 \text{ mA}/1 \text{ A} \times 100 = 0.06 \% \text{ (see "AC Current (Sine Waves) Specifications").}$$

PF Adder Watts Adder for PF = 1 ($\Phi=0$) at 60 Hz is 0 % (see "Phase Specifications").

$$\text{Total Watts Output Uncertainty} = U_{\text{power}} = \sqrt{0.021^2 + 0.06^2 + 0^2} = 0.064\%$$

Example 2 Output: 100 V, 1 A, 400 Hz, Power Factor = 0.5 ($\Phi=60$)

Voltage Uncertainty Uncertainty for 100 V at 400 Hz is, 150 ppm + 2 mV, totaling:

$$100 \text{ V} \times 190 \times 10^{-6} = 19 \text{ mV added to 2 mV} = 21 \text{ mV. Expressed in percent: } 21 \text{ mV}/100 \text{ V} \times 100 = 0.021 \% \text{ (see "AC Voltage (Sine Wave) Specifications").}$$

Current Uncertainty Uncertainty for 1 A is 0.05 % 100 μA , totaling:

$$1 \text{ A} \times 0.0005 = 500 \mu\text{A added to } 100 \mu\text{A} = 0.6 \text{ mA. Expressed in percent: } 0.6 \text{ mA}/1 \text{ A} \times 100 = 0.06 \% \text{ (see "AC Current (Sine Waves) Specifications").}$$

PF Adder Watts Adder for PF = 0.5 ($\Phi=60$) at 400 Hz is 0.76 % (see "Phase Specifications").

$$\text{Total Watts Output Uncertainty} = U_{\text{power}} = \sqrt{0.021^2 + 0.06^2 + 0.76^2} = 0.77\%$$

VARs When the Power Factor approaches 0.0, the Watts output uncertainty becomes unrealistic because the dominant characteristic is the VARs (volts-amps-reactive) output. In these cases, calculate the Total VARs Output Uncertainty, as shown in example 3:

Example 3 Output: 100 V, 1 A, 60 Hz, Power Factor = 0.174 ($\Phi=80$)

Voltage Uncertainty Uncertainty for 100 V at 400 Hz is, 150 ppm + 2 mV, totaling:
 $100 \text{ V} \times 190 \times 10^{-6} = 15 \text{ mV}$ added to 2 mV = 17 mV. Expressed in percent:
 $17 \text{ mV}/100 \text{ V} \times 100 = 0.017 \%$ (see "AC Voltage (Sine Wave) Specifications").

Current Uncertainty Uncertainty for 1 A is 0.05 %, 100 μA , totaling:
 $1 \text{ A} \times 0.0005 = 500 \mu\text{A}$ added to 100 μA = 0.6 mA. Expressed in percent:
 $0.6 \text{ mA}/1 \text{ A} \times 100 = 0.06 \%$ (see "AC Current (Sine Waves) Specifications").

VARs Adder VARs Adder for $\Phi=80$ at 60 Hz is 0.03 % (see "Phase Specifications").

Total VARs Output Uncertainty = $U_{\text{VARs}} = \sqrt{0.017^2 + 0.06^2 + 0.03^2} = 0.069\%$

Additional Specifications

The following paragraphs provide additional specifications for the 5522A Calibrator ac voltage and ac current functions. These specifications are valid after allowing a warm-up period of 30 minutes, or twice the time the 5522A has been turned off. All extended range specifications are based on performing the internal zero-cal function at weekly intervals, or when the ambient temperature changes by more than 5 °C.

Frequency

Frequency Range	Resolution	1-Year Absolute Uncertainty, tcal ±5 °C	Jitter
0.01 to 119.99 Hz	0.01 Hz	2.5 ppm +5 μHz ^[1]	100 nS
120.0 to 1199.9 Hz	0.1 Hz		
1.200 to 11.999 kHz	1.0 Hz		
12.00 to 119.99 kHz	10 Hz		
120.0 to 1199.9 kHz	100 Hz		
1.200 to 2.000 MHz	1 kHz		
[1] With REF CLK set to ext, the frequency uncertainty of the 5522A is the uncertainty of the external 10 MHz clock ±5 μHz. The amplitude of the 10 MHz external reference clock signal should be between 1 V and 5 V p-p.			

Harmonics (2nd to 50th)

Fundamental Frequency ^[1]	Voltages NORMAL Terminals	Currents	Voltages AUX Terminals	Amplitude Uncertainty
10 to 45 Hz	33 mV to 32.9999 V	3.3 mA to 2.99999 A	10 mV to 5 V	Same % of output as the equivalent single output, but twice the floor adder.
45 to 65 Hz	33 mV to 1020 V	3.3 mA to 20.5 A	10 mV to 5 V	
65 to 500 Hz	33 mV to 1020 V	33 mA to 20.5 A	100 mV to 5 V	
500 Hz to 5 kHz	330 mV to 1020 V	33 mA to 20.5 A	100 mV to 5 V	
5 to 10 kHz	3.3 to 1020 V	33 to 329.9999 mA	100 mV to 5 V	
10 to 30 kHz	3.3 to 1020 V	33 to 329.9999 mA	100 mV to 3.29999 V	
[1] The maximum frequency of the harmonic output is 30 kHz (10 kHz for 3 to 5 V on the Aux terminals). For example, if the fundamental output is 5 kHz, the maximum selection is the 6th harmonic (30 kHz). All harmonic frequencies (2nd to 50th) are available for fundamental outputs between 10 Hz and 600 Hz (200 Hz for 3 to 5 V on the Aux terminals).				

Phase UncertaintyPhase uncertainty for harmonic outputs is 1 degree or the phase uncertainty shown in "Phase Specifications" for the particular output, whichever is greater. For example, the phase uncertainty of a 400 Hz fundamental output and 10 kHz harmonic output is 10 ° (from "Phase Specifications"). Another example, the phase uncertainty of a 60 Hz fundamental output and a 400 Hz harmonic output is 1 degree.

Example of determining Amplitude Uncertainty in a Dual Output Harmonic Mode

What are the amplitude uncertainties for the following dual outputs?

NORMAL (Fundamental) Output:

100V, 100 Hz.....From "AC Voltage (Sine Wave) Specifications" the single output specification for 100V, 100 Hz, is 0.015 % + 2 mV. For the dual output in this example, the specification is 0.015 % + 4 mV as the 0.015 % is the same, and the floor is twice the value (2 x 2 mV).

AUX (50th Harmonic) Output:

100 mV, 5 kHz.....From "AC Voltage (Sine Wave) Specifications" the auxiliary output specification for 100 mV, 5 kHz, is 0.15 % + 450 mV. For the dual output in this example, the specification is 0.15 % 900 mV as the 0.15 % is the same, and the floor is twice the value (2 x 450 mV).

[1] Offsets are not allowed on ranges above the highest range shown above. [2] The maximum offset value is determined by the difference between the peak value of the selected voltage output and the allowable maximum peak signal. For example, a 10 V p-p square wave output has a peak value of 5 V, allowing a maximum offset up to ± 50 V to not exceed the 55 V maximum peak signal. The maximum offset values shown above are for the minimum outputs in each range. [3] For frequencies 0.01 to 10 Hz, and 500 kHz to 2 MHz, the offset uncertainty is 5 % of output, ±1 % of the offset range.
